wfilebuf
wfstream
wifstream
wofstream

ofstream

ofstream::ofstream
public member functions:
ofstream::close
ofstream::is_open
ofstream::open
ofstream::operator=
ofstream::rdbuf
ofstream::swap
non-member overloads:
swap (basic_ofstream)

public member function

std::ofstream::open

<fstream>

C++98 C++11 ?

void open (const char* filename, ios_base::openmode mode = ios_base::out);

Open file
Opens the file identified by argument *filename*, associating it with the stream object, so that input/output operations are performed on its content. Argument *mode* specifies the *opening mode*.

If the stream is already associated with a file (i.e., it is already *open*), calling this function fails.

The file association of a stream is kept by its *internal stream buffer*:
Internally, the function calls `rdbuf()->open(filename,mode|ios_base::out)`

C++98 C++11 ?

The function sets `failbit` in case of failure.

Parameters

filename

String with the name of the file to open.
Specifics about its format and validity depend on the library implementation and running environment.

mode

Flags describing the requested input/output mode for the file.
This is an object of the bitmask member type `openmode` that consists of a combination of the following member constants:

member constant	stands for	access
in	input	File open for reading: the <i>internal stream buffer</i> supports input operations.
out *	output	File open for writing: the <i>internal stream buffer</i> supports output operations.
binary	binary	Operations are performed in binary mode rather than text.
ate	at end	The <i>output position</i> starts at the end of the file.
app	append	All output operations happen at the end of the file, appending to its existing contents.
trunc	truncate	Any contents that existed in the file before it is open are discarded.

These flags can be combined with the bitwise OR operator (`|`).
* out is always set for `ofstream` objects (even if explicitly not set in argument *mode*).
Note that even though `ofstream` is an output stream, its internal `filebuf` object may be set to also support input operations.

C++98 C++11 ?

If the mode has both `trunc` and `app` set, the opening operation fails. It also fails if both `app` and `in` are set simultaneously.

Return Value

none

If the function fails to open a file, the *failbit state flag* is set for the stream (which may throw `ios_base::failure` if that *state flag* was registered using member *exceptions*).

Example

```

1 // ofstream::open / ofstream::close
2 #include <fstream>           // std::ofstream
3
4 int main () {
5
6     std::ofstream ofs;
7     ofs.open ("test.txt", std::ofstream::out | std::ofstream::app);
8
9     ofs << " more lorem ipsum";
10
11     ofs.close();
12
13     return 0;
14 }

```

● **Data races**

Modifies the `ofstream` object.
Concurrent access to the same `stream` object introduce data races.

● **Exception safety**

Basic guarantee: if an exception is thrown, the `stream` is in a valid state.
It throws an exception of member type `failure` if the function fails (setting the `failbit` state flag) and member `exceptions` was set to throw for that state.
